Authorized Attack-Surface Inventory and Change Monitor

Generated: 2026-10-30T09:45:42+00:00

Executive summary

2 configured assets; 1 successful scans in the latest 50 records; 0 current unresolved findings. Changes and potential issues are evidence for review, not automatic vulnerability claims.

Scope and authorized assets

Type	Configured asset	Authorized
domain	example.com	Yes
host	127.0.0.1	Yes

Scan methodology and limitations

The application queries DNS for configured names, validates TLS certificates using the platform trust store, and connects only to individual TCP ports explicitly listed in the configuration. It does not discover arbitrary addresses, probe unconfigured ports, exploit services, or verify ownership of third-party resources. Timeouts and scanner errors are inconclusive and are not treated as proof that a record or service was removed.

Latest successful scan

Scan 1 — 2026-10-30T09:08:28+00:00 (completed)

Active baseline

Baseline 1 — scan 1 (2026-10-30T09:08:31+00:00)

DNS inventory

Asset	Check	Observed value	Details
example.com	A	["104.20.23.154", "172.66.147.243"]	{"error": null, "status": "RECORD_FOUND"}
example.com	AAAA	["2606:4700:10::6814:179a", "2606:4700:10::ac42:93f3"]	{"error": null, "status": "RECORD_FOUND"}
example.com	CNAME	[]	{"error": {"message": "The DNS response does not contain an answer to the question: example.com. IN CNAME", "type": "NoAnswer"}, "status": "NO_RECORD"}

TLS certificate results

No observations recorded.

Port monitoring results

Asset	Check	Observed value	Details
127.0.0.1	CLOSED_PORT	8000	{"port": 8000}

Findings and review status

No findings are recorded.

Scan history

ID	Source	Timestamp	Status	Assets	Findings	Error
1	manual	2026-10-30T09:08:28+00:00	completed	2	0	

Conclusion

This report reflects only the configured authorized scope and the results persisted at generation time. Confirm changes with asset owners before taking action.
